

Real-time
visibility for your
infrastructure,
trade execution
and apps

Ready to build
a full picture
of your buy
side
organization?

Get an end-to-end view into your IT estate in one single place

When operating in the high-pressure environment of capital markets, ensuring your business-critical systems are always on is not optional.

You need to avoid costly outages, protect your revenue and keep your IT infrastructure resilient, even in times of high demand. As a buy side player, you need to do all this while dealing with extremely large volumes of data, high exposure to financial risk

and unpredictable transaction volumes.

The increasing complexity of capital markets paired with complete reliance on technology can cause lack of visibility into liquidity costs and trade efficiency, which can deteriorate the performance and profitability of buy side organizations.

In fact, without proper data analysis, traders are left blind to their exposure to risk, which

can lead to large financial losses. Having complete visibility into the end-to-end transactions and associated business processes provides buy side organizations with the tools needed to analyze the cost, performance, and risk associated with each transaction.

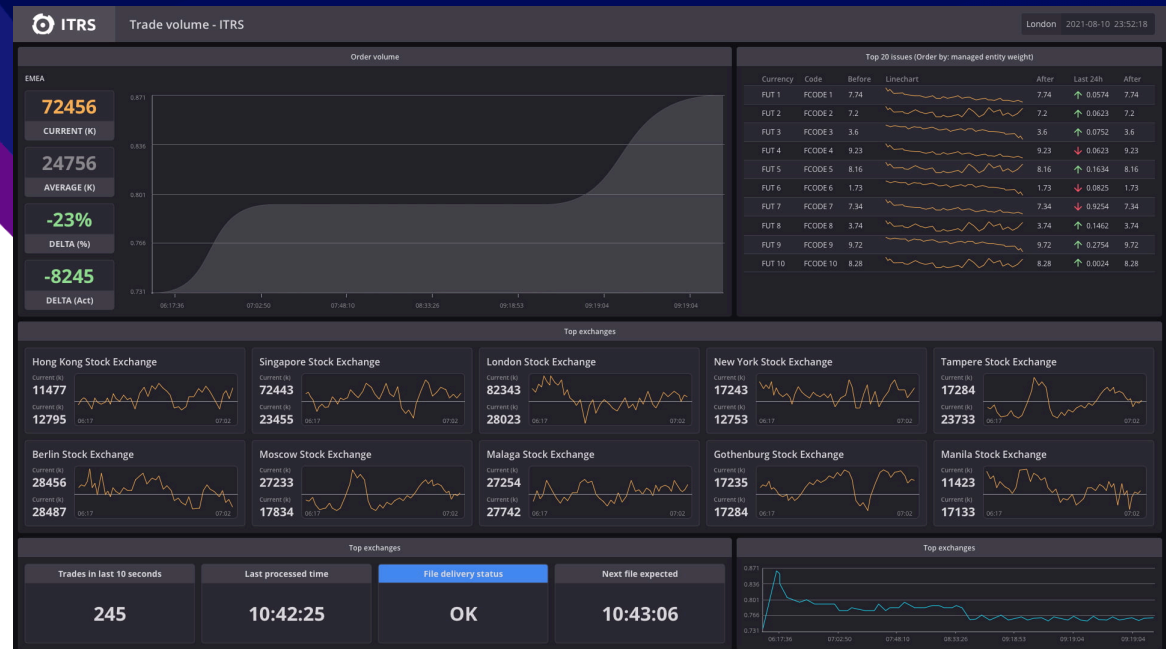

Implementing the right data collection and analysis strategy gives traders the tools to execute the most efficient trades, as risk-free and quickly as possible.

End-to-end visibility through dynamic dashboards

This is where ITRS Group comes in. We have over 20 years' experience supporting firms operating in capital markets with our real-time monitoring and analytics solutions, and we understand that the stakes are even higher for buy side institutions. **Here's how we can help your business:**

Our dynamic dashboards react instantly to data changes and are highly customisable, allowing you to build your own view of complex business processes for different audiences, including technical and business users. They give you real-time observability over your infrastructure, applications, trading execution and asset management, and can help you map your business-critical processes to ensure they're always on, supporting business continuity and regulatory compliance.

Data processing & market data feeds

In the data-driven and data-heavy environment of buy side trading, the ability to access and analyse data in real time is key. Furthermore, accessing market data feeds allows portfolio managers to make the right decisions at the right time by understanding market trends that can help shape their investment decisions. ITRS gives you real-time, easy to digest visibility into your own data, as well as access to the market data you need to make profitable and reduced risk decisions about your funds.

Full oversight of trade execution and asset management

ITRS gives you an end-to-end view over your trade execution, asset allocation, settling and clearing, ensuring your trading processes are running consistently and compliantly. By monitoring the hierarchical mappings between different services and technology components, we can support the performance and reliability of all your trading and asset management systems, showing you how they're doing in real time.

Reducing technological risk

We know buy side businesses often run many bespoke applications for their portfolio managers. These applications operate in real time and are mission critical to the operations of the business. At ITRS, we provide observability into these applications, ensuring availability and business operations' continuity.

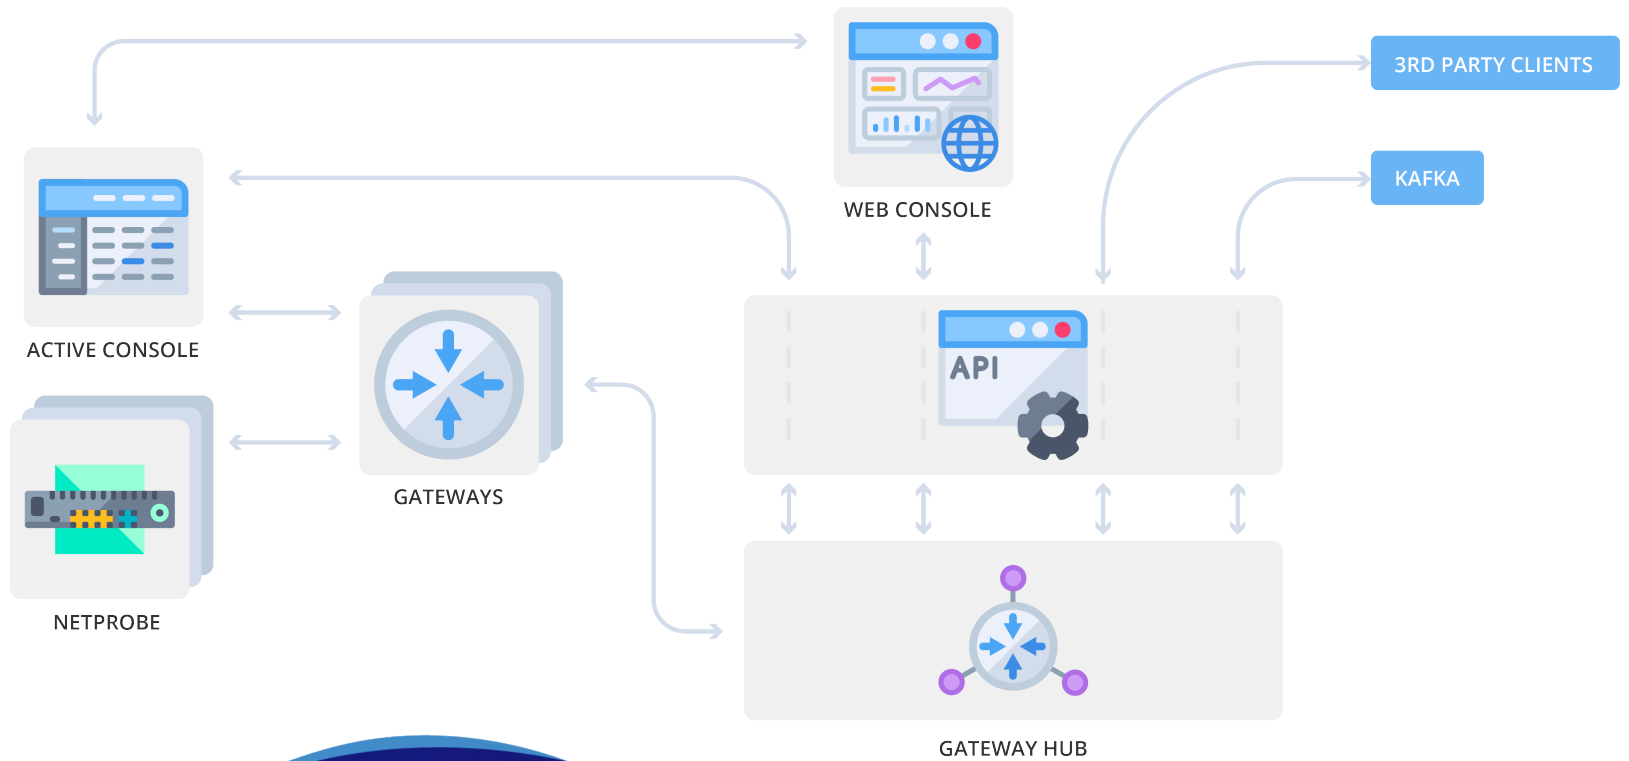

Integration and interoperability

ITRS Geneos integrates seamlessly across different technologies, with over 100 preconfigured, out-of-the-box plugins. This gives you the flexibility to integrate with open-source systems and create a monitoring solution that can respond to change quickly and is tailored to your specific needs.

Auto-resolution of issues before they impact critical processes

Identify, diagnose and resolve issues before they impact your business performance. You can drill down from high-level to detailed views and request more information during the investigation and triage of issues. You can then automate corrective actions, ensuring problems are detected and resolved before they impact your bottom line or your ability to meet regulatory requirements.

ITRS

Geneos

Geneos was built with capital markets in mind, to support the most complex and interconnected IT estates through real-time monitoring and data analysis for transactions, processes, applications and infrastructure. Get real-time visibility across on-prem, cloud and highly dynamic containerised environments, protecting your funds' performance and your revenue.
